

RentCast Data Propagation Lag Research

RentCast API Specifics: Data Refresh and Propagation Lag

Based on the available documentation, developer forums, and API specifications, there is no publicly disclosed information regarding **RentCast's** specific data refresh cadence, the typical lag for deed recordings, or known delays in their public records pipeline ^{[1][2][3][4][5][6][7][8][9]}.

While tools like the **RentCastPython** client receive **daily** updates to reflect API schema changes, this does not indicate the refresh rate of the underlying property data itself ^[13]. Furthermore, developer discussions and integration guides for platforms like **dltHub** and **Pipedream** focus on pipeline construction rather than data latency or deed propagation times ^{[10][11][12][14]}.

Real Estate Data Sourcing and Aggregation

Because individual county public records are notoriously fragmented, inconsistent, and often outdated, third-party real estate APIs rarely connect directly to individual county feeds ^[18]. Instead, the industry relies heavily on major real estate data aggregators to compile, standardize, and deliver this information ^[18].

While **RentCast's** exact vendor mix is not specified in the provided context, platforms offering nationwide property data, valuations, and ownership records typically source their raw data through aggregators like **ATTOM Data Solutions** and **CoreLogic** ^{[15][16][18]}.

These aggregators build their databases by:

- Sourcing owner and deed records directly from over **3,000** county tax assessor and recorder offices nationwide ^{[15][17][20]}.
- Utilizing proprietary data management programs, such as **ATTOM's 20-step** validation process, to standardize the raw county data ^[17].
- Integrating multiple sources, including geospatial data, licensed real estate brokers, and SaaS platforms, to mitigate the inherent delays of raw public records ^{[18][19]}.

Industry Benchmarks: Propagation Time and Refresh Cadence

The propagation time from a county recording a deed to that data appearing in a third-party API depends entirely on the aggregator powering the API. The industry benchmarks for the top data providers show distinct differences in refresh cadences:

Data Aggregator	Refresh Cycle	US Property Coverage	Data Attributes	Source
CoreLogic	24hours	98%	200+	[16]
ATTOM Data	48hours	95%	150+	[16]

Note: While **ATTOM** updates its general property attributes every **48hours**, it does provide **daily** updates for specific datasets like foreclosure activity ^{[15][16]} and **monthly** updates for building permit data ^[17].

Key Takeaway on Data Lag: The speed of data propagation is critical for real estate applications. Industry benchmarks indicate that data latency exceeding **24hours** can reduce the predictive performance of real estate AI and valuation models by **12-18%**^[16]. Consequently, aggregators with shorter propagation lags, like **CoreLogic**, are often favored for dynamic market analysis and real-time enterprise applications ^[16].
